

### **Netscape Communicator Tips**

When you encounter a JavaScript error or want to watch a command-line JavaScript processing, you can use Netscape Communicator's built-in JavaScript console. You can access this console by typing

```
javascript:
```

into the location bar. This JavaScript console is a mini HTML page. The bottom pane has the caption javascript typein. When you access this console from the location bar, you can change the caption for cosmetic reasons. For example, you can modify the caption to JAVASCRIPT typein or JaVaScRiPt typein by typing

```
JAVASCRIPT
```

or

```
JaVaScRiPt
```

You can also browse the Web from this console. To navigate to <http://www.win2000mag.com/>, type the following command into the JavaScript typein pane:

```
var d; d = window.open("http://  
www.win2000mag.com/","_top")
```

Communicator breaks the frames in the console and loads the *Windows 2000 Magazine* home page into the console. The console window is resizeable, so you can maximize it when you use it as a browsing tool.
